

## PATIENTS IN PAIN AFTER BACK SURGERY MAY AVOID ADDITIONAL PROCEDURES AND COSTS

### Clinical Trial Health Economics Results for Provant<sup>®</sup> Therapy

December 2014 Newsletter

Persistent pain after surgery may lead to reduced physical function and sense of well-being, and increased consumption of healthcare resources. In a prospective study, Provant treatment was associated with improved pain scores, improved overall well-being and physical function, reduced analgesic consumption, and avoidance of costly procedures.

#### PROSPECTIVE CLINICAL STUDY PROCEDURE AVOIDANCE RESULTS

- Patients were in persistent pain after back surgery.
- Average 16 months post-op.
- Treated with Provant Therapy twice daily for 45 days.
- 28 patients participated in the 3-month follow-up.
- 14 patients were considering a total of 19 procedures prior to using Provant.
- At 3-month follow-up, only 3 procedures had been performed.
- \$14,452 average potential savings for these 14 patients.

Provant accomplishes this by helping tissue move through, and out of, inflammation. To learn more how RegenesiS Biomedical may help your patients and you, please contact your local representative, or visit [www.regenesiSbio.com](http://www.regenesiSbio.com)
