

SAFE, NON-DRUG PAIN MANAGEMENT

Provant® Therapy Has Been Shown to Reduce the Use of Pain Medications

August 2015 Newsletter

Persistent pain may lead to reduced physical function and sense of well-being, expensive invasive procedures, and increased consumption of opioid analgesics. A non-drug alternative is Provant Therapy, which has been shown to reduce pain med use. Here is a summary of outcomes in four patients that treated for pain after back surgery:

Case	Postoperative Time Period prior to Provant	Before Provant	After Provant
44-year old female	1 year postoperative	Pain score: 10/10 Interventions: Methadone, gabapentin, baclofen, nortriptyline, and etodolac; selective lumbar nerve root blocks, left piriformis muscle/sciatic nerve block	Pain score: 2/10 Interventions: Decreased amount of daily opioid medications and took less than prescribed. No further nerve blocks were required.
51-year old female	10 years postoperative	Pain score: 8/10 Interventions: Oral morphine, hydrocodone/paracetamol, and baclofen; intrathecal morphine pump; epidural steroid injection	Pain score: 4-5/10 Interventions: Discontinued morphine; No further invasive interventions were required.
66-year old male	3 months postoperative	Pain score: 9/10 Interventions: Oral morphine and gabapentin; epidural steroid injection	Pain score: 7/10 Interventions: Reduced intake of morphine
30-year old male	2 years postoperative	Pain score: 10/10 Interventions: Oral morphine, hydrocodone/paracetamol, and gabapentin; facet joint injection, epidural steroid injection	Pain score: 3/10 Interventions: Discontinued morphine and gabapentin; no further steroid injections required, and no further pain clinic visits

Provant electromagnetic energy achieves these outcomes through its anti-nociceptive analgesia and anti-inflammatory effects. You may find more clinical evidence for Provant Therapy [here](#).
