

STUDY FINDS REDUCED PAIN AFTER PROVANT[®] TREATMENT

Case Series of 40 patients with 10 pain syndromes

November 2015 Newsletter

This is the first large Provant case series, covering 10 different pain syndromes in 40 patients. Included were abdominal pain; rotator cuff; knee, ankle and lumbar facet osteoarthritis; radiculopathy; spinal stenosis; failed back syndrome; myofascial; and diabetic neuropathy. All patients were post procedural and had failed conservative treatment. Pain scores were assessed at 4 time points: baseline, after an in-clinic trial, 4 weeks, and 8 weeks. Statistical significance was achieved at 4 weeks and 8 weeks compared to baseline.

This figure shows pain scores over time, and the number of patients treating at each time point:

The full article may be found [here](#), which includes pain scores for each of the 10 diagnoses.

Over 11,500 patients have treated with Provant. To learn more, please contact your RegenesiS representative, or visit www.regenesiSbio.com.

Sincerely,

Adrienne (Patti) Smith, MD
Vice President, Clinical Business and Medical Affairs
