

# 10 PAIN SYNDROMES IMPROVED WITH PROVANT® TREATMENT

## Studied patients had failed conservative treatment

December 2015 Newsletter

A recently published 40-patient case series assessed 10 chronic pain syndromes. The patients had failed conservative treatment. Pain scores were assessed before and after Provant treatment. Overall, there was a statistically significant reduction in initial pain from 7.9 to 3.0 at 8 weeks.

The graph below compares and trends the average pain scores for each of the 10 pain diagnoses. Initial is baseline pre-Provant; post-trial is after one in-clinic treatment; 4 and 8 weeks are follow-up times from the patients' self-treating at home.

Over 11,500 patients have treated with Provant. To learn more, please contact your RegenesiS representative, or visit [www.regenesibio.com](http://www.regenesibio.com). The full article may be found [here](#).

Sincerely,

Adrienne (Patti) Smith, MD
